

Stairway installation instructions.

1. Remove packing materials and straps from the stairs.
2. Separate the steel bracket from the top stair tread by removing the nuts and washers. (The steel bracket was bolted on just for shipping purposes.)
3. Attach the steel bracket to the seawall, or fixed dock in the location where you want to access the stairs. Make sure the bracket is level on both left-right and forward-back axes. The bracket may be bolted through the round holes, or welded. Having the steel bracket level will make all of the stair treads level, as this controls the attitude of all other treads.

4. Allowing the stairs to unfold, place the stairs so the roller (bottom) is on the floating dock, and the top tread on top of the steel extensions.
5. Align the bolts in the staircase with the slotted holes in the steel bracket. Tighten the nuts and washers as shown in the picture
